1 Introduction

1.1 Security Target Identification

Title: Hewlett-Packard Digital Sender Flow 8500 fn1 Document Capture Workstation Firmware with Jetdirect Inside Security Target

Version: 1.3

Status: Final

Date: 2015-02-26

Sponsor: Hewlett-Packard Development Company, L.P.

Developer: Hewlett-Packard Development Company, L.P.

Certification Body: CSEC

Certification ID: CSEC2014009

Keywords: Hewlett-Packard, HP, Document Capture Workstation, HCD, Jetdirect Inside

1.2 TOE Identification

The TOE is the Hewlett-Packard Digital Sender Flow 8500 fn1 Document Capture Workstation Firmware with Jetdirect Inside.

1.3 TOE Type

The TOE type is the internal firmware providing the functionality of a document capture workstation (i.e., scanner).

1.4 TOE Overview

The Hewlett-Packard Digital Sender Flow 8500 fn1 is an enterprise network document capture workstation (DCW) designed to be shared by many users. It is designed to meet the requirements of the [PP2600.2] protection profile in conjunction with [CCEVS-PL20] in the environment defined by these two documents (the Policy Letter modifies the requirements and environment).

This hardcopy device (HCD), as it is called in [PP2600.2], provides the ability to scan documents. It is a self-contained unit that includes processors, memory, networking, a storage drive, and an image scanner. Two operating systems, two web servers, and Control Panel applications (i.e., applications that run internally on the HCD) reside within the firmware of the HCD.

The TOE is the contents of the firmware with the exception of the operating systems and the QuickSec cryptographic library (used by IPsec), which are part of the Operational Environment.

The document capture workstation model for which the firmware is evaluated is listed in the following table along with the evaluated firmware version numbers:

<table>
<thead>
<tr>
<th>DCW (HCD) Model</th>
<th>TOE Firmware Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>HP Digital Sender Flow 8500 fn1 Document Capture Workstation</td>
<td>DCW Firmware version: 2304061_439465 Jetdirect Inside version: JDI23400008.FF</td>
</tr>
</tbody>
</table>

Table 1: TOE Reference
This model provides the following security features:

- Auditing
- Cryptography
- Identification and authentication
- Data protection and access control
- Protection of the TSF (restricted forwarding, TSF self-testing, timestamps)
- TOE access protection (inactivity timeout and automatic logout)
- Trusted channel communication and certificate management
- User and access management

1.4.1 Required and optional non-TOE hardware, software, and firmware

The following *required* firmware components are considered part of the Operational Environment:

- Operating systems (included in the firmware)
- QuickSec cryptographic library module (included in the firmware)

The hardware portion of the DCW is considered part of the Operational Environment. The TOE is evaluated on the model defined in Table 1 and *requires* this model in order to run in the evaluated configuration.

The following *required* components are part of the Operational Environment:

- DNS server
- NTP server
- Syslog server
- WINS server
- One Administrative Computer connected to the TOE via a network connection.

The following *optional* components are part of the Operational Environment:

- HP Web Jetadmin administrative tool
- Windows domain controller/Kerberos server
- LDAP server
- Remote file systems:
  - CIFS
  - FTP
- Microsoft SharePoint
- SMTP gateway
- Web browser

1.4.2 Intended method of use

[PP2600.2] is defined for a commercial information processing environment in which a moderate level of document security, network security, and security assurance are required.
The TOE is intended to be used in non-hostile, networked environments where TOE users have direct physical access to the HCD for scanning. The physical environment should be reasonably controlled and/or monitored where physical tampering of the HCD would be evident and noticed.

The TOE can be connected to an administrative computer as well as to authenticated servers via a local area network using HP's Jetdirect Inside in the evaluated configuration. The evaluated configuration uses secure network mechanisms for communication between the network computers and the TOE. The TOE is managed by one designated Administrative Computer. The TOE is not intended to be connected to the Internet.

The evaluated configuration contains a built-in user identification and authentication database (a.k.a. sign in method) used for Local Device Sign In that is part of the TOE. It also supports a Windows domain controller (via Kerberos) for a feature called Windows Sign In and a Lightweight Directory Access Protocol (LDAP) authentication server for a feature called LDAP Sign In to identify and authenticate users. The Windows domain controller and LDAP server are part of the Operational Environment.

The evaluated configuration supports the optional HP Web Jetadmin administrative tool for managing the TOE. This tool uses the Hypertext Transfer Protocol (HTTP), Hypertext Markup Language (HTML), Simple Object Access Protocol (SOAP), Extensible Markup Language (XML), Open Extensibility Platform device layer (OXPd) Web Services, WS-* Web Services, and Simple Network Management Protocol (SNMP) to communicate to the TOE. (The Web Jetadmin administrative tool is part of the Operational Environment.) The evaluated configuration also supports the Embedded Web Server (EWS) interface for managing the TOE using a web browser over HTTP. (Web browsers are part of the Operational Environment.)

The evaluated configuration supports remote file systems for storing scanned documents remotely. In addition, it supports Microsoft SharePoint for sending scanned documents.

All Universal Serial Bus (USB) Type-A ports are disabled in the evaluated configuration.

1.5 TOE Description

1.5.1 TOE architecture

As mentioned previously, the TOE is the firmware of an enterprise document capture workstation designed to be shared by many human users. It performs the functions of scanning and sending of documents. It can be connected to a local network through the embedded Jetdirect Inside's built-in Ethernet.
Figure 1 shows a high-level physical diagram of an HCD with the unshaded areas inside the HCD representing the TOE and the shaded areas indicating components that are part of the Operational Environment.

At the top of this figure is a box showing the Administrative Computer which connects to the TOE using Internet Protocol Security (IPsec) with X.509v3 certificates for both mutual authentication and for protection of data from disclosure and alteration. This computer can administer the TOE using the following interfaces over the IPsec connection:
- Embedded Web Server (EWS)
- Simple Network Management Protocol (SNMP)
- Web Services:
  - Open Extensibility Platform device (OXPd) Web Services
  - WS-* Web Services

The EWS administrative interface uses the HTTP protocol which allows administrators to remotely manage the features of the TOE using a web browser.

The Web Services allow administrators to manage the TOE using HP's Web Jetadmin application, which is part of the Operational Environment. The TOE supports both HP's Open Extensibility Platform device (OXPd) Web Services and certain WS-* Web Services (conforming to the WS-* standards defined by w3.org) accessed via the Simple Object Access Protocol (SOAP) and Extensible Markup Language (XML).

The SNMP network interface allows administrators to remotely manage the TOE using external SNMP-based administrative applications like the HP Web Jetadmin administrative tool.

The TOE protects all network communications with Internet Protocol Security (IPsec), which is part of the embedded Jetdirect Inside firmware. Though IPsec supports multiple authentication methods, in the evaluated configuration, both ends of the IPsec connection are authenticated using X.509v3 certificates. An identity certificate for the TOE must be created outside the TOE, signed by a Certificate Authority (CA), and imported (added) into the TOE with the Certificate Authority's CA certificate.

Because IPsec authenticates the computers (IPsec authenticates the computer itself; IPsec does not authenticate the individual users of the computer), access to the Administrative Computer should be restricted to TOE administrators only.

The TOE distinguishes the Administrative Computer from other computers on the network by using IP addresses, IPsec, and the embedded Jetdirect Inside's internal firewall. In the evaluated configuration, the number of Administrative Computers used to manage the TOE is limited to one. In addition, the Device Administrator Password must be set.

The evaluated configuration supports the following SNMP versions:
- SNMPv1 read-only
- SNMPv2c read-only
- SNMPv3

The TOE supports Microsoft SharePoint and remote file systems for the storing of scanned documents. The TOE uses IPsec with X.509v3 certificates to protect the communications and to mutually authenticate to SharePoint and the remote file systems. For remote file system connectivity, the TOE supports the File Transfer Protocol (FTP) and the Common Internet File System (CIFS) protocol. (SharePoint is HTTP-based.) The product is also capable of encrypting scanned documents according to the Adobe PDF specification.

The TOE can be used to email scanned documents. It supports protected communications between the TOE and Simple Mail Transfer Protocol (SMTP) gateways. It uses IPsec with X.509v3 certificates to protect the communications and to mutually authenticate with the SMTP gateway. The TOE can only protect unencrypted email up to the SMTP gateway. It is the responsibility of the Operational Environment to protect emails from the SMTP gateway to the email's destination. Also, the TOE can only send emails; it does not accept inbound emails.

The TOE's Control Panel supports the following local and remote sign in methods:
Local sign in method:
  - Local Device Sign In

Remote sign in methods:
  - LDAP Sign In
  - Windows Sign In (via Kerberos)

The local sign in method is called Local Device Sign In which supports individual user accounts. The user account information is maintained in the Local Device Sign In database within the TOE. The remote sign in methods are called LDAP Sign In and Windows Sign In (i.e., Kerberos). The TOE uses IPsec with X.509v3 certificates to protect both the LDAP and Kerberos communications.

The HCD contains a user interface called the Control Panel. The Control Panel consists of a touch sensitive LCD screen, a brightness-adjustment control, reset button, start button, stop button, sleep button, and various LEDs. A physical power button exists on the left side of the HCD. In addition, the HCD includes a pullout keyboard as part of the Control Panel. The Control Panel is the physical interface that a user uses to communicate with the TOE when physically using the HCD. The LCD screen displays information such as menus and status to the user. It also provides virtual buttons to the user such as an alphanumeric keypad for entering usernames and passwords. When a user signs in at the Control Panel, a Permission Set is associated with their session which determines the functions the user is permitted to perform.

The Scanner is the part of the HCD that converts hardcopy documents into electronic format.

The HCD contains a persistent storage drive (a.k.a. storage drive) that resides in the Operational Environment. This storage drive is an HP High Performance Secure Hard Disk which is a self-encrypting drive (SED). The encryption performed by this drive is outside the scope of this evaluation.

The TOE supports the auditing of security relevant functions by generating and forwarding audit records to a remote syslog server. The TOE uses IPsec with X.509v3 certificates to protect the communications between the TOE and the syslog server and to mutually authenticate the TOE and syslog server.

The Jetdirect Inside Firmware and HCD System Firmware components comprise the firmware on the system. They are shown as two separate components and they contain separate operating systems. While each operating system is included in the firmware, both operating systems are outside of the TOE (i.e., the operating systems are in the Operational Environment). Both firmware components also contain an Embedded Web Server (EWS).

The Jetdirect Inside firmware includes SNMP, IPsec, a firewall, and the management functions for managing these network features. The Jetdirect Inside firmware also provides the network stack and drivers controlling the TOE’s Ethernet interface.

The HCD System Firmware controls the overall functions of the TOE from the Control Panel to the storage drive.

Figure 2 shows the HCD boundary in grey and the firmware (TOE) boundary in blue (the TOE being comprised of the HCD System firmware and the Jetdirect Inside firmware excluding the underlying operating systems and the QuickSec cryptographic library). The Jetdirect Inside firmware provides the network connectivity and network device drivers used by the HCD System firmware. The HCD System firmware also includes internal Control Panel applications that drive the functions of the TOE. Both firmware components work together to provide the security functionality defined in this document for the TOE.
Figure 2: HCD logical diagram
1.5.2 TOE security functionality (TSF) summary

1.5.2.1 Auditing

The TOE performs auditing of security relevant functions. Both the Jetdirect Inside and HCD System firmware generate audit records. The TOE connects and sends audit records to a syslog server for long-term storage and audit review. (The syslog server is part of the Operational Environment.)

1.5.2.2 Cryptography

The TOE uses IPsec to protect its communications channels. The QuickSec cryptographic library, which is part of the Operational Environment, is used to supply the cryptographic algorithms for IPsec. See section 1.5.2.7 for more information.

The product includes functionality to encrypt certain types of scan jobs using the Adobe PDF specification. This encryption functionality is not part of the claimed security functions of the TOE. Instead, the TOE uses IPsec to protect its communication channels.

The product includes functionality to encrypt email using S/MIME and X.509v3 certificates. This encryption functionality is not part of the claimed security functions of the TOE. Instead, the TOE uses IPsec to protect its communications channels.

1.5.2.2.1 Cryptography outside the scope of the TOE

This section exists to inform the reader that the HCD contains other cryptography that is outside the scope of the TOE, is not part of this evaluation, and is not used to fulfill any of the [PP2600.2] requirements.

The HP High Performance Secure Hard Disk provides hardware-based cryptography and persistent storage. Data on this drive is encrypted and the encryption key is locked to the device. The cryptographic functionality is transparent to the TOE and to the user.

1.5.2.3 Identification and authentication

1.5.2.3.1 Control Panel I&A

The HCD has a Control Panel used to select a function (a.k.a. Control Panel application) to be performed. The Control Panel supports both local and remote sign in methods.

The mechanism for the local sign in method, which is part of the TOE firmware, is called:

- Local Device Sign In

Remote sign in methods used by the TOE are:

- LDAP Sign In
- Windows Sign In (via Kerberos)

For successful remote authentication, Control Panel users must enter their username and password as defined by the remote sign in method.

All users must sign in before being presented with the home screen allowing access to Control Panel applications. Prior to signing in, the TOE can be configured to display a Welcome message on which the user must press "OK" before the user can access the sign in screen. At the sign in screen, the user may get help on various printer functions or select a sign in method prior to signing in. The sign in method selections are:

- Local Device Sign In:
When users sign in through the Control Panel, the TOE displays asterisks for each character of an Access Code or password typed to prevent onlookers from viewing the authentication data. The TOE also contains a mechanism called Simplified Account Lockout that slows the Control Panel authentication attempts when multiple unsuccessful authentication attempts occur.

### 1.5.2.3.2 IPsec I&A

An Administrative Computer can connect to the TOE to manage the TOE. The TOE uses IPsec to identify and mutually authenticate any computer that attempts to connect to it.

The Administrator Computer that connects to the TOE is considered an IPsec user. The TOE uses the IP address to identify this user and X.509v3 certificates to authenticate the user. The IP address must be defined to the TOE's IPsec firewall in order for the computer to be considered authorized to access the TOE. Any computer not defined to the TOE's IPsec/Firewall is considered unauthorized and is blocked by the firewall from accessing the TOE.

The TOE uses IPsec/Firewall address templates, service templates, and rules to map IP addresses to network service protocols. An address template contains one or more IP addresses. A service template contains one or more allowed network service protocols. A rule contains a mapping of an address template to a service template. Through the use of rules, an administrator defines which computer is the Administrator Computer.

In the evaluated configuration, the IPsec/firewall only allows the Administrative Computer to connect to all interfaces supported by the TOE. Table 2 shows the mapping of the Administrative Computer to the TOE's network protocols.

<table>
<thead>
<tr>
<th>IPsec user</th>
<th>Allowed network protocol access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Computer (U.ADMINISTRATOR)</td>
<td>EWS (HTTP), OXPd, WS-*, SNMP</td>
</tr>
</tbody>
</table>

**Table 2: IPsec user mapping to allowed network protocols**

Because IPsec mutual authentication is performed at the computer level, not the user level, the computer allowed by the firewall to access the TOE via the network protocols specified in table 2 must itself be the Administrative Computer. This means that non-TOE administrative users should not be allowed to logon to the Administrative Computer because every user of the Administrative Computer is potentially a TOE administrator.

IPsec is configured to use X.509v3 certificates via the Internet Key Exchange (IKE) protocols IKEv1 and IKEv2 in the evaluated configuration.

In addition, the TOE can contact many types of trusted IT products using IPsec and mutual authentication over the interfaces specified in section 1.5.4.1. The TOE contacts these computers either to send data to them (e.g., send a scanned object in an email to the SMTP Gateway) or to request information from them (e.g., authenticate a user using LDAP). The TOE mutually authenticates these servers using IPsec prior to sending data to them.
1.5.2.4 Data protection and access control

1.5.2.4.1 Permission Sets

Each Control Panel application requires one or more permissions in order to execute it. These permissions are defined in Permission Sets (a.k.a. Control Panel User Roles). The applied Permission Set can be a combination of various Permission Sets associated with a user. The default Permission Sets in the evaluated configuration are:

- Device Administrator (assigned to U.ADMINISTRATOR)
- Device User (assigned to U.NORMAL)

The TOE includes a Device Guest Permission Set, but it has no enabled permissions in the evaluated configuration. Additional (custom) Permission Sets can be created and applied by the administrator in the evaluated configuration.

These default Permission Sets cannot be created, renamed or deleted. In addition, the permissions in Device Administrator cannot be modified.

The Device Administrator Permission Set has more permissions enabled than the Device User Permission Set. For example, the Device Administrator Permission Set has a “Details or Cancel any user’s job” permission enabled which allows a U.ADMINISTRATOR user to view the details of or cancel any user's job. The Device User Permission Set has this permission disabled in the evaluated configuration; therefore, the TOE denies a U.NORMAL user permission to view the details of or cancel any user's job.

Permission Set data is stored in the TOE and managed via EWS and WS-* Web Services.

1.5.2.4.2 Common access control

Scan jobs are ephemeral on the TOE by design. The TOE does not provide a user the ability to store a scan job on the HCD and retrieve it later. Because of this, only the U.NORMAL user creating the scan job has access to the scan job and only this user can read and delete the scan job document and modify and delete the job's function data. Other U.NORMAL users do not have access to this scan job. In addition, an administrator can delete (cancel) an active scan job due to an enabled permission in the Device Administrator Permission Set.

1.5.2.4.3 TOE function access control

For Control Panel users, the TOE controls access to Control Panel applications (e.g., Email) using Permission Sets and, optionally, sign-in methods (authentication databases). Permission Sets act as User Roles to determine if the user can perform a function controlled by permissions.

Each Control Panel application requires the user to have one or more specific permissions in their session Permission Set in order to access that application. In addition, the TOE’s administrator can map sign in methods to each Control Panel application and require the user to be authenticated to that sign in method in order to access that application. The individual applications only check and enforce permissions. They do not check the sign in methods. Instead, the TOE enforces the sign in method requirement at the time that the user signs in to the TOE by removing permissions from the user's session Permission Set for each application in which the user's sign in method does not match the sign in method required by the TOE. By removing the permissions required by each non-matching application, the TOE limits the set of applications that the user can access.

Administrators can change/modify the sign in method mapped to each application. In addition, the TOE contains a function that allows administrators to select if the sign in method application mappings are enforced or ignored by the TOE. This function is called "Allow users to choose alternate
sign-in methods." When this function is disabled, the TOE enforces the "sign in method to application" mappings and prunes (reduces) the user's session Permission Set accordingly. When this function is enabled, the sign in method mappings are ignored by the TOE and the user's session Permission Set remains unchanged.

For IPsec users, the TOE uses the IPsec/Firewall to control access to the supported network protocols. The IPsec/Firewall contains the IP addresses of authorized computers grouped into address templates and the network service protocols grouped into service templates. The administrator maps an address template to a service template using an IPsec/Firewall rule. Service templates, therefore, act as the User Roles. IP addresses of computers not contained in a rule are denied access to the TOE.

1.5.2.4.4 Residual information protection
The TOE protects deleted objects by making them unavailable to TOE users via the TOE's interfaces. This prevents TOE users from attempting to recover deleted objects of other users via the TOE interfaces.

1.5.2.5 Protection of the TSF

1.5.2.5.1 Restricted forwarding of data to external interfaces
The TOE prevents the forwarding of data received from an External Interface to the Shared-medium Interface.

1.5.2.5.2 TSF self-testing
The TOE contains a suite of self tests to test specific security functionality of the TOE. It contains data integrity checks for testing specific TSF Data of the TOE and for testing the stored TOE executables.

1.5.2.5.3 Reliable timestamps
The TOE contains a system clock that is used to generate reliable timestamps. In the evaluated configuration, the TOE synchronizes the system clock with a Network Time Protocol (NTP) server.

1.5.2.6 TOE access protection

1.5.2.6.1 Inactivity timeout
The Control Panel supports an inactivity timeout in case users forget to logout of the Control Panel after logging in.

1.5.2.6.2 Automatic logout
The Control Panel supports the following administrator-selectable automatic logout functions:
- Sign out the user immediately after starting the job
- Sign out the user 10 seconds after starting the job with the user-selectable option to remain signed in

If the user logs in and never starts a job, the inactivity timeout feature will terminate the session.
1.5.2.7 Trusted channel communication and certificate management

The TOE supports IPsec which provides encryption and decryption to protect data being transferred over the Shared-medium Interface. IPsec uses IP addresses and X.509v3 certificates to identify and authenticate the Administrative Computer as well as other trusted IT products to which the TOE connects (e.g., syslog server, NTP server, SMTP gateway).

The TOE uses several cryptographic algorithms with IPsec. These cryptographic algorithms, supplied by the QuickSec cryptographic library, are all part of the Operational Environment, but the TOE controls the usage of these algorithms. Also, the TOE uses a software-based random number generator in the Operational Environment when creating symmetric encryption keys used as communications session keys and secret keys used during data integrity verification.

In addition, the TOE provides certificate management functions used to manage (add, replace, delete) X.509v3 certificates.

1.5.2.8 User and access management

The TOE provides management capabilities for managing its security functionality. The TOE supports the following roles:

- administrators (U.ADMINISTRATOR)
- users (U.NORMAL)

Administrators have the authority to manage the security functionality of the TOE and to manage users. Users can only manage user data that they have access to on the TOE.

1.5.3 TOE boundaries

1.5.3.1 Physical

The physical boundary of the TOE is the programs and data stored in the firmware of the HCD (except for the embedded operating systems and the QuickSec cryptographic library) and the English-language guidance documentation.

It is typical for an HCD, and thus the TOE, to be shared by many users and for those users to have direct physical access to the HCD. By design, users have easy access to some of the hardware features, such as the Control Panel, the scanner, and the power switch. But other features such as the processor, firmware, and storage drive are located inside the HCD in the formatter cage. The formatter cage can be secured to the HCD's chassis using a combination lock, thus, restricting normal user access to the components inside the cage.

Because of the restricted access to the storage drive, the drive is considered a non-removable nonvolatile storage device from the perspective of [PP2600.2].

Due to the physical accessibility of the HCDs, they must be used in non-hostile environments. Physical access should be controlled and/or monitored.

QuickSec version 5.1 ([QuickSec51]) library implements the TOE's IPsec including the IPsec/Firewall. QuickSec includes a cryptographic library. Although the IPsec implementation in QuickSec is in the TOE boundary, the QuickSec cryptographic library used by QuickSec for all IPsec cryptography is part of the Operational Environment. QuickSec is developed and tested by SafeNet, Inc.
Regarding the SMTP gateway, the TOE can only provide protection of sent emails to the device with which the TOE has the IPsec connection (i.e., the TOE only provides protection between the TOE and SMTP gateway). After that point, the Operational Environment must provide the remaining protection necessary to transfer the email from the SMTP gateway to the email's addressee(s).

1.5.3.2 Logical

The security functionality provided by the TOE has been described above and includes:

- Auditing
- Cryptography
- Identification and authentication
- Data protection and access control
- Protection of the TSF (restricted forwarding, TSF self-testing, timestamps)
- TOE access protection (inactivity timeout and automatic logout)
- Trusted channel communication and certificate management
- User and access management

1.5.3.3 Evaluated configuration

The following items will need to be adhered to in the evaluated configuration:

- HP Digital Sending Software (DSS) must be disabled
- HP High Performance Secure Hard Disk must be configured with a password if the user wishes to activate drive encryption
- Device Administrator Password must be set as per P.ADMIN.PASSWORD
- Only one Administrative Computer is used to manage the TOE
- HP and third party applications cannot be installed on the TOE
- Type A USB ports must be disabled
- Jetdirect Inside management via telnet and FTP must be disabled
- Jetdirect XML Services must be disabled
- IPsec authentication using X.509v3 certificates must be enabled (IPsec authentication using Kerberos or Pre-Shared Key is not supported)
- IPsec Authenticated Headers (AH) must be disabled
- IPsec IKE Main Mode for key exchange must be used
- Full Authentication must be enabled (this disables the Guest account)
- SNMP support limited to:
  - SNMPv1 read-only
  - SNMPv2c read-only
  - SNMPv3
- The Service PIN, used by a customer support engineer to access functions available to HP support personnel, must be disabled
- When using Windows Sign In, the Windows domain must reject Microsoft NT LAN Manager (NTLM) connections
- The "Save to HTTP" function is disallowed and must not be configured to function with an HTTP server
- Display Names for the Local Device Sign In method users and user names for the LDAP and Windows Sign In method users must only contain the characters defined in P.USERNAME.CHARACTER_SET.
- Remote Control-Panel use is disallowed as per P.REMOTE_PANEL.DISALLOWED

### 1.5.4 Security policy model

This section describes the security policy model for the TOE. Much of the terminology in this section comes from [PP2600.2] and is duplicated here so that readers won't have to read [PP2600.2] to understand the terminology used in the rest of this Security Target document.

### 1.5.4.1 Subjects/Users

Users are entities that are external to the TOE and which interact with the TOE. TOE users are defined in Table 3.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>U.USER</td>
<td>Any authorized User. Authorized Users are U.ADMINISTRATOR and U.NORMAL.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>U.NORMAL</td>
<td>A User who is authorized to perform User Document Data processing functions of the TOE.</td>
</tr>
<tr>
<td>U.ADMINISTRATOR</td>
<td>A User who has been specifically granted the authority to manage some portion or all of the TOE and whose actions may affect the TOE security policy (TSP). A password must be set for all U.ADMINISTRATOR accounts in the evaluated configuration.</td>
</tr>
</tbody>
</table>

**Table 3: Users**

For the purpose of clarity in this Security Target, the following distinctions are made:

- **Control Panel users** – U.NORMAL and U.ADMINISTRATOR users who physically access the TOE's Control Panel.
  - **Security attributes**: User Role (defined by Permission Set) and User Identifier

- **IPsec users**:
  - **Administrative Computer** – Computer (U.ADMINISTRATOR entities) that can successfully authenticate to the TOE's administrative interfaces (e.g., EWS (HTTP), OXPd, WS-*, SNMP) using IPsec and mutual authentication.
    - **Security attributes**: User Role (defined by IPsec/Firewall service template) and User Identifier (defined by IP address)

### 1.5.4.2 Objects

Objects are passive entities in the TOE that contain or receive information, and upon which Subjects perform Operations. Objects are equivalent to TOE Assets. There are three types of Objects:

- User Data
- TSF Data
Functions

1.5.4.2.1 User Data
User Data are data created by and for Users and do not affect the operation of the TOE Security Functionality (TSF). This type of data is comprised of two objects:

- User Document Data
- User Function Data

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.DOC</td>
<td>User Document Data consists of the information contained in a user's document. This includes the original document itself in hardcopy or electronic form, image data, or residually-stored data created by the HCD while processing an original document and printed hardcopy output(^1).</td>
</tr>
<tr>
<td>D.FUNC</td>
<td>User Function Data are the information about a user's document or job to be processed by the TOE.</td>
</tr>
</tbody>
</table>

Table 4: User Data

User Data objects include:

- **Scan job types (+SCN):**
  - **Email jobs** - Scan jobs that are scanned directly into an email and sent from the TOE to an SMTP gateway.
  - **Save to Network Folder jobs** - Scan jobs that are saved to a remote file system.
  - **Save to SharePoint jobs** - Scan jobs that are saved to a SharePoint server.

Since this is a single function device (i.e., a scanner), D.DOC and D.DOC+SCN are equivalent and D.FUNC and D.FUNC+SCN are equivalent. "+SCN" is defined in section 1.5.4.4.

1.5.4.2.2 TSF Data
TSF Data are data created by and for the TOE and that might affect the operation of the TOE. This type of data is comprised of two components: TSF Protected Data and TSF Confidential Data.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.CONF</td>
<td>TSF Confidential Data are assets for which either disclosure or alteration by a user who is neither an administrator nor the owner of the data would have an effect on the operational security of the TOE.</td>
</tr>
<tr>
<td>D.PROT</td>
<td>TSF Protected Data are assets for which alteration by a user who is neither an administrator nor the owner of the data would have an effect on the operational security of the TOE, but for which disclosure is acceptable.</td>
</tr>
</tbody>
</table>

Table 5: TSF Data

\(^1\) Although D.DOC from [PP2600.2] contains the phrase "printed hardcopy output," the TOE is a scanner and does not produce printed hardcopy output.
The following table lists the TSF Data and the data designations.

<table>
<thead>
<tr>
<th>TSF Data</th>
<th>D.CONF</th>
<th>D.PROT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit records</td>
<td></td>
<td>X</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>User and Administrator identification data</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>User and Administrator authentication data</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

**Table 6: TSF Data Listing**

1.5.4.3 SFR package functions

Functions perform processing, storage, and transmission of data. The following [PP2600.2]-defined functions apply to this Security Target.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>F.SCN</td>
<td>Scanning: a function in which physical document input is converted to electronic document output</td>
</tr>
<tr>
<td>F.SMI</td>
<td>Shared-medium interface: a function that transmits or receives User Data or TSF Data over a communications medium which, in conventional practice, is or can be simultaneously accessed by multiple users, such as wired network media and most radio-frequency wireless media</td>
</tr>
</tbody>
</table>

**Table 7: SFR package functions**

1.5.4.4 SFR package attributes

When a function is performing processing, storage, or transmission of data, the identity of the function is associated with that particular data as a security attribute. The following [PP2600.2]-defined attributes apply to this Security Target.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>+SCN</td>
<td>Indicates data that is associated with a scan job.</td>
</tr>
<tr>
<td>Designation</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------</td>
<td>------------</td>
</tr>
<tr>
<td>+SMI</td>
<td>Indicates data that is transmitted or received over a shared-medium interface.</td>
</tr>
</tbody>
</table>

Table 8: SFR package attributes
2 CC Conformance Claim

This Security Target is CC Part 2 extended and CC Part 3 conformant, with a claimed Evaluation Assurance Level of EAL2, augmented by ALC_FLR.2.

This Security Target claims conformance to the following Protection Profiles and PP packages, if any:

- [PP2600.2-SCN]: SFR Package for Hardcopy Device Scan Functions. Version 1.0 as of December 2009; demonstrable conformance.
- [PP2600.2-SMI]: SFR Package for Hardcopy Device Shared-medium Interface Functions. Version 1.0 as of December 2009; demonstrable conformance.

Common Criteria [CC] version 3.1 revision 4 is the basis for this conformance claim.

2.1 Protection Profile tailoring and additions

2.1.1 IEEE Std 2600.2-2009; "2600.2-PP, Protection Profile for Hardcopy Devices, Operational Environment B" (with NIAP CCEVS Policy Letter #20) ([PP2600.2])

In this Security Target, [PP2600.2] has been modified to conform with the NIAP CCEVS Policy Letter #20 ([CCEVS-PL20]).

Although the HCDs in this Security Target contain a nonvolatile storage device (i.e., a storage drive), this device is considered an internal, built-in component of the HCDs and, therefore, constitutes a non-removable nonvolatile storage device from the perspective of [PP2600.2] and [CCEVS-PL20]. Because no removable nonvolatile storage devices exist in the HCDs, this Security Target does not claim conformance to "2600.2-NVS SFR Package for Hardcopy Device Nonvolatile Storage Functions, Operational Environment B" contained in [PP2600.2].

The following tables provide the mappings of and rationale for how the SFRs in this Security Target map to the SFRs in the protection profile [PP2600.2]. The term "n/a" means "not applicable". The term "common" is used to refer to that portion of [PP2600.2] to which all TOEs must conform (i.e., the portions not labeled as packages).

<table>

3 Security Problem Definition

3.1 Introduction

The statement of TOE security environment describes the security aspects of the environment in which the TOE is intended to be used and the manner in which it is expected to be deployed.

To this end, the statement of TOE security environment identifies the list of assumptions made on the Operational Environment (including physical and procedural measures) and the intended method of use of the product, defines the threats that the product is designed to counter, and the organizational security policies with which the product is designed to comply.

3.2 Threat Environment

This security problem definition addresses threats posed by four categories of threat agents:

a) Persons who are not permitted to use the TOE who may attempt to use the TOE
b) Persons who are authorized to use the TOE who may attempt to use TOE functions for which they are not authorized.

c) Persons who are authorized to use the TOE who may attempt to access data in ways for which they not authorized.
d) Persons who unintentionally cause a software malfunction that may expose the TOE to unanticipated threats.

The threats and policies defined in this Security Target address the threats posed by these threat agents.

The threat agents are assumed to originate from a well managed user community in a non-hostile working environment. Therefore, the product protects against threats of security vulnerabilities that might be exploited in the intended environment for the TOE with low level of expertise and effort. The TOE protects against straightforward or intentional breach of TOE security by attackers possessing a Basic attack potential.

3.2.1 Threats countered by the TOE

**T.DOC.DIS**

User Document Data may be disclosed to unauthorized persons.

**T.DOC.ALT**

User Document Data may be altered by unauthorized persons.

**T.FUNC.ALT**

User Function Data may be altered by unauthorized persons.

**T.PROT.ALT**

TSF Protected Data may be altered by unauthorized persons.

**T.CONF.DIS**

TSF Confidential Data may be disclosed to unauthorized persons.
T.CONF.ALT
TSF Confidential Data may be altered by unauthorized persons.

3.3 Assumptions

3.3.1 Environment of use of the TOE

3.3.1.1 Physical

A.ACCESS.MANAGED
The TOE is located in a restricted or monitored environment that provides protection from unmanaged access to the physical components and data interfaces of the TOE.

A.ADMIN.PC.SECURE
The Administrative Computer is in a physically secured and managed environment and only the authorized administrator has access to it.

A.USER.PC.POLICY
User computers are configured and used in conformance with the organization's security policies.

3.3.1.2 Personnel

A.USER.TRAINING
TOE Users are aware of the security policies and procedures of their organization, and are trained and competent to follow those policies and procedures.

A.ADMIN.TRAINING
Administrators are aware of the security policies and procedures of their organization, are trained and competent to follow the manufacturer's guidance and documentation, and correctly configure and operate the TOE in accordance with those policies and procedures.

A.ADMIN.TRUST
Administrators do not use their privileged access rights for malicious purposes.

3.3.1.3 Connectivity

A.SERVICES.RELIABLE
When the TOE uses any of the network services CIFS, FTP, DNS, Kerberos, LDAP, NTP, SMTP, SharePoint, syslog, and/or WINS, these services provide reliable information and responses to the TOE.
3.4 Organizational Security Policies

3.4.1 Included in the PP2600.2 protection profile

P.USER.AUTHORIZATION
To preserve operational accountability and security, Users will be authorized to use the TOE only as permitted by the TOE Owner.

P.SOFTWARE.VERIFICATION
To detect corruption of the executable code in the TSF, procedures will exist to self-verify executable code in the TSF.

P.AUDIT.LOGGING
To preserve operational accountability and security, records that provide an audit trail of TOE use and security-relevant events will be created, maintained, and protected from unauthorized disclosure or alteration, and will be reviewed by authorized personnel.

P INTERFACE MANAGEMENT
To prevent unauthorized use of the external interfaces of the TOE, operation of those interfaces will be controlled by the TOE and its IT environment.

3.4.2 In addition to the PP2600.2 protection profile

P.ADMIN.PASSWORD
To restrict access to administrative tasks, the Device Administrator Password will be set in the evaluated configuration so that the password is required to perform security-relevant actions through EWS (HTTP), WS-*, or at the Control Panel.

P.USERNAME.CHARACTER_SET
To prevent ambiguous user names in the TOE's audit trail, the Display Names of the Local Device Sign In method users and the user names of the LDAP and Windows Sign In method users must only contain ASCII printable characters except for the double quote (22 hex) and single quote (27 hex) characters (i.e., allowed ASCII characters in hexadecimal: 20, 21, 23 - 26, 28 - 7E).

P.REMOTE_PANEL.DISALLOWED
To preserve operational accountability and security, administrators must not use the Remote Control-Panel feature.
4 Security Objectives

4.1 Objectives for the TOE

O.AUDIT.LOGGED
The TOE shall create and maintain a log of TOE use and security-relevant events, and prevent its unauthorized disclosure or alteration.

O.CONF.NO_ALT
The TOE shall protect TSF Confidential Data from unauthorized alteration.

O.CONF.NO_DIS
The TOE shall protect TSF Confidential Data from unauthorized disclosure.

O.DOC.NO_ALT
The TOE shall protect User Document Data from unauthorized alteration.

O.DOC.NO_DIS
The TOE shall protect User Document Data from unauthorized disclosure.

O.FUNC.NO_ALT
The TOE shall protect User Function Data from unauthorized alteration.

OINTERFACE.MANAGED
The TOE shall manage the operation of external interfaces in accordance with security policies.

O.PROT.NO_ALT
The TOE shall protect TSF Protected Data from unauthorized alteration.

O.SOFTWARE.VERIFIED
The TOE shall provide procedures to self-verify executable code in the TSF.

O.USER.AUTHORIZED
The TOE shall require identification and authentication of Users, and shall ensure that Users are authorized in accordance with security policies before allowing them to use the TOE.

4.2 Objectives for the Operational Environment

O.E.ADMIN.PC.SECURE
The TOE Owner shall locate the Administrative Computer in a physically secured and managed environment and allow only authorized personnel access to it.
OE.ADMIN.TRAINED

The TOE Owner shall ensure that TOE Administrators are aware of the security policies and procedures of their organization; have the training, competence, and time to follow the manufacturer's guidance and documentation; and correctly configure and operate the TOE in accordance with those policies and procedures.

OE.ADMIN.TRUSTED

The TOE Owner shall establish trust that TOE Administrators will not use their privileged access rights for malicious purposes.

OE.AUDIT.REVIEWED

The TOE Owner shall ensure that audit logs are reviewed at appropriate intervals for security violations or unusual patterns of activity.

OE.AUDIT_ACCESS.AUTHORIZED

If audit records generated by the TOE are exported from the TOE to another trusted IT product, the TOE Owner shall ensure that those records can be accessed in order to detect potential security violations, and only by authorized persons.

OE.AUDIT_STORAGE.PROTECTED

If audit records are exported from the TOE to another trusted IT product, the TOE Owner shall ensure that those records are protected from unauthorized access, deletion and modifications.

OE INTERFACE.MANAGED

The IT environment shall provide protection from unmanaged access to TOE external interfaces.

OE PHYSICAL.MANAGED

The TOE shall be placed in a secure or monitored area that provides protection from unmanaged physical access to the TOE.

OE SERVICES.RELIABLE

When the TOE uses the network services CIFS, FTP, DNS, Kerberos, LDAP, NTP, SMTP, SharePoint, syslog, and/or WINS, these services shall provide reliable information and responses to the TOE.

OE USER.AUTHORIZED

The TOE Owner shall grant permission to Users to be authorized to use the TOE according to the security policies and procedures of their organization.

OE USER.PC.POLICY

The TOE Owner shall create a set of security policies to which user computers will conform.
**OE.USER.TRAINED**

The TOE Owner shall ensure that Users are aware of the security policies and procedures of their organization, and have the training and competence to follow those policies and procedures.

**OE.USERNAME.CHARACTER_SET**

The Display Names of all Local Device Sign In method users and the user names of all LDAP and Windows Sign In method users shall only contain ASCII printable characters except for the double quote (22 hex) and single quote (27 hex) characters (i.e., allowed ASCII characters in hexadecimal: 20, 21, 23 - 26, 28 - 7E).

### 4.3 Security Objectives Rationale

#### 4.3.1 Coverage

The following table provides a mapping of TOE objectives to threats and policies, showing that each objective counters or enforces at least one threat or policy, respectively.

<table>
<thead>

4.3.2 Sufficiency

The following rationale provides justification that the security objectives are suitable to counter each individual threat and that each security objective tracing back to a threat, when achieved, actually contributes to the removal, diminishing or mitigation of that threat:

<table>
<thead>
<tr>
<th>Threat</th>
<th>Rationale for security objectives</th>
</tr>
</thead>
</table>
| T.DOC.DIS | The threat:  
  ● User Document Data may be disclosed to unauthorized persons.  
  is countered by:  
  ● O.DOC.NO_DIS which protects D.DOC from unauthorized disclosure.  
  ● O.USER.AUTHORIZED which establishes user identification and authentication as the basis for authorization. |
<table>
<thead>

<tr>
<td></td>
<td>● O.FUNC.NO_ALT which protects D.FUNC from unauthorized alteration.</td>
</tr>
<tr>
<td></td>
<td>● O.USER.AUTHORIZED which establishes user identification and authentication as the basis for authorization.</td>
</tr>
<tr>
<td></td>
<td>● OE.USER.AUTHORIZED which establishes responsibility of the TOE Owner to appropriately grant authorization.</td>
</tr>
<tr>
<td>T.PROT.ALT</td>
<td>The threat:</td>
</tr>
<tr>
<td></td>
<td>● TSF Protected Data may be altered by unauthorized persons.</td>
</tr>
<tr>
<td></td>
<td>is countered by:</td>
</tr>
<tr>
<td></td>
<td>● O.PROT.NO_ALT which protects D.PROT from unauthorized alteration.</td>
</tr>
<tr>
<td></td>
<td>● O.USER.AUTHORIZED which establishes user identification and authentication as the basis for authorization.</td>
</tr>
<tr>
<td></td>
<td>● OE.USER.AUTHORIZED which establishes responsibility of the TOE Owner to appropriately grant authorization.</td>
</tr>
<tr>
<td>T.CONF.DIS</td>
<td>The threat:</td>
</tr>
<tr>
<td></td>
<td>● TSF Confidential Data may be disclosed to unauthorized persons.</td>
</tr>
<tr>
<td></td>
<td>is countered by:</td>
</tr>
<tr>
<td></td>
<td>● O.CONF.NO_DIS which protects D.CONF from unauthorized disclosure.</td>
</tr>
<tr>
<td></td>
<td>● O.USER.AUTHORIZED which establishes user identification and authentication as the basis for authorization.</td>
</tr>
<tr>
<td></td>
<td>● OE.USER.AUTHORIZED which establishes responsibility of the TOE Owner to appropriately grant authorization.</td>
</tr>
<tr>
<td>T.CONF.ALT</td>
<td>The threat:</td>
</tr>
<tr>
<td></td>
<td>● TSF Confidential Data may be altered by unauthorized persons.</td>
</tr>
</tbody>
</table>
### Rationale for security objectives

Threat is countered by:

- **O.CONF.NO_ALT** which protects D.CONF from unauthorized alteration.
- **O.USER.AUTHORIZED** which establishes user identification and authentication as the basis for authorization.
- **OE.USER.AUTHORIZED** which establishes responsibility of the TOE Owner to appropriately grant authorization.

#### Table 15: Sufficiency of objectives countering threats

The following rationale provides justification that the security objectives for the environment are suitable to cover each individual assumption, that each security objective for the environment that traces back to an assumption about the environment of use of the TOE, when achieved, actually contributes to the environment achieving consistency with the assumption, and that if all security objectives for the environment that trace back to an assumption are achieved, the intended usage is supported:

<table>
<thead>
<tr>
<th>Assumption</th>
<th>Rationale for security objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.ACCESS.MANAGED</td>
<td>The assumption:</td>
</tr>
<tr>
<td></td>
<td>● The TOE is located in a restricted or monitored environment that provides protection from unmanaged access to the physical components and data interfaces of the TOE.</td>
</tr>
<tr>
<td></td>
<td>is upheld by:</td>
</tr>
<tr>
<td></td>
<td>● <strong>OE PHYSICAL MANAGED</strong> which establishes a protected physical environment for the TOE.</td>
</tr>
<tr>
<td>A.ADMIN.PC.SECURE</td>
<td>The assumption:</td>
</tr>
<tr>
<td></td>
<td>● The Administrative Computer is in a physically secured and managed environment and only the authorized administrator has access to it.</td>
</tr>
<tr>
<td></td>
<td>is upheld by:</td>
</tr>
<tr>
<td></td>
<td>● <strong>OE ADMIN.PC.SECURE</strong> which establishes the responsibility of the TOE owner to locate the Administrative Computer in a physically secured and managed environment and allow only authorized personnel access to it.</td>
</tr>
<tr>
<td>A.USER.PC.POLICY</td>
<td>The assumption:</td>
</tr>
<tr>
<td></td>
<td>● User computers are configured and used in conformance with the organization's security policies.</td>
</tr>
<tr>
<td></td>
<td>is upheld by:</td>
</tr>
<tr>
<td></td>
<td>● <strong>OE.USER.PC.POLICY</strong> which establishes the responsibility of the TOE owner to create a set of security policies to which user computers will conform.</td>
</tr>
<tr>
<td>A.USER.TRAINING</td>
<td>The assumption:</td>
</tr>
</tbody>
</table>
### Assumption | Rationale for security objectives
--- | ---
- TOE Users are aware of the security policies and procedures of their organization, and are trained and competent to follow those policies and procedures. is upheld by:
  - OE.USER.TRAINED which establishes responsibility of the TOE Owner to provide appropriate User training.

#### A.ADMIN.TRAINING

The assumption:
- Administrators are aware of the security policies and procedures of their organization, are trained and competent to follow the manufacturer’s guidance and documentation, and correctly configure and operate the TOE in accordance with those policies and procedures.

is upheld by:
- OE.ADMIN.TRAINED which establishes responsibility of the TOE Owner to provide appropriate Administrator training.

#### A.ADMIN.TRUST

The assumption:
- Administrators do not use their privileged access rights for malicious purposes.

is upheld by:
- OE.ADMIN.TRUSTED which establishes responsibility of the TOE Owner to have a trusted relationship with Administrators.

#### A.SERVICES.RELIABLE

The assumption:
- When the TOE uses any of the network services CIFS, FTP, DNS, Kerberos, LDAP, NTP, SMTP, SharePoint, syslog, and/or WINS, these services provide reliable information and responses to the TOE.

is upheld by:
- OE.SERVICES.RELIABLE which, when the TOE uses the network services CIFS, FTP, DNS, Kerberos, LDAP, NTP, SMTP, SharePoint, syslog, and/or WINS, establishes that these services provide reliable information and responses to the TOE.

### Table 16: Sufficiency of objectives holding assumptions

The following rationale provides justification that the security objectives are suitable to cover each individual organizational security policy, that each security objective that traces back to an OSP, when achieved, actually contributes to the implementation of the OSP, and that if all security objectives that trace back to an OSP are achieved, the OSP is implemented:

<table>
<thead>
<tr>
<th>OSP</th>
<th>Rationale for security objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td>P.USER.AUTHORIZATION</td>
<td>The OSP:</td>
</tr>
</tbody>
</table>
  - To preserve operational accountability and security, Users will be authorized to use the TOE only as permitted by the TOE Owner. |
<table>
<thead>
<tr>
<th>OSP</th>
<th>Rationale for security objectives</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>is enforced by:</td>
</tr>
<tr>
<td></td>
<td>● O.USER.AUTHORIZED which establishes user identification and authentication as the basis for authorization to use the TOE.</td>

**Table 17: Sufficiency of objectives enforcing Organizational Security Policies**
5 Extended Components Definition

[PP2600.2-SMI] defines the following extended component:

- FPT_FDI_EXP.1: Restricted forwarding of data to external interfaces

5.1 Class FPT: Protection of the TSF

This section describes the functional requirements for the restrictions of forwarding of data to external interfaces. This extended component is defined in [PP2600.2-SMI].

5.1.1 Restricted forwarding of data to external interfaces (FDI)

Family behaviour

This family defines requirements for the TSF to restrict direct forwarding of information from one external interface to another external interface.

Many products receive information on specific external interfaces and are intended to transform and process this information before it is transmitted on another external interface. However, some products may provide the capability for attackers to misuse external interfaces to violate the security of the TOE or devices that are connected to the TOE's external interfaces. Therefore, direct forwarding of unprocessed data between different external interfaces is forbidden unless explicitly allowed by an authorized administrative role. The family FPT_FDI_EXP has been defined to specify this kind of functionality.

Component levelling

FPT_FDI_EXP.1 Restricted forwarding of data to external interfaces provides for the functionality to require TSF controlled processing of data received over defined external interfaces before these data are sent out on another external interface. Direct forwarding of data from one external interface to another one requires explicit allowance by an authorized administrative role.

Management: FPT_FDI_EXP.1

There are no management activities foreseen.

Audit: FPT_FDI_EXP.1

There are no audit events foreseen.

5.1.1.1 FPT_FDI_EXP.1 - Restricted forwarding of data to external interfaces

Hierarchical to: No other components.

Dependencies: No dependencies.

FPT_FDI_EXP.1.1 The TSF shall provide the capability to restrict data received on [assignment: list of external interfaces] from being forwarded without further processing by the TSF to [assignment: list of external interfaces].
6 Security Requirements

6.1 TOE Security Functional Requirements

The following table shows the security functional requirements for the TOE, and the operations performed on the components according to CC part 2: iteration (Iter.), refinement (Ref.), assignment (Ass.) and selection (Sel.).

Table 18: Security functional requirements for the TOE

### 6.1.1 Security audit (FAU)

#### 6.1.1.1 Audit data generation (FAU_GEN.1)

**FAU_GEN.1.1** The TSF shall be able to generate an audit record of the following auditable events:

- a) Start-up and shutdown of the audit functions; and
- b) All auditable events for the **not specified** level of audit; and
- c) **All Auditable Events as each is defined for its Audit Level (if one is specified) for the Relevant SFR in Table 19; none.**
The TSF shall record within each audit record at least the following information:

a) Date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event; and

b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST, for each Relevant SFR listed in Table 19: (1) information as defined by its Audit Level (if one is specified), and (2) all Additional Information (if any is required); none.

<table>
<thead>
<tr>
<th>Auditable event</th>
<th>Relevant SFR(s)</th>

<td>No</td>
</tr>
</tbody>
</table>

Table 19: Auditable events

6.1.1.2 User identity association (FAU_GEN.2)

For audit events resulting from actions of identified users, the TSF shall be able to associate each auditable event with the identity of the user that caused the event.

6.1.2 Cryptographic support (FCS)

6.1.2.1 Cryptographic key generation (FCS_CKM.1)

The QuickSec cryptographic library in the Operational Environment TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm defined in Table 20 and specified cryptographic key sizes defined in Table 20 that meet the following: the standards defined in Table 20.
### Table 20: Cryptographic key generation

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Key generation algorithm</th>
<th>Key sizes (in bits)</th>
<th>Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPsec</td>
<td>AES</td>
<td>128, 192, 256</td>
<td>[RFC4301] Security Architecture for the Internet Protocol</td>
</tr>
<tr>

<td>96</td>
<td>[RFC2404] The Use of HMAC-SHA-1-96 within ESP and AH; [RFC4301] Security Architecture for the Internet Protocol; [RFC4894] Use of Hash Algorithms in Internet Key Exchange (IKE) and IPsec</td>
</tr>
<tr>
<td></td>
<td>HMAC-SHA-384-196</td>
<td>384</td>
<td></td>
</tr>
<tr>
<td></td>
<td>HMAC-SHA-512-256</td>
<td>512</td>
<td></td>
</tr>
</tbody>
</table>

**Application Note:** Key generation for FCS_CKM.1 is implemented with the SSH random number generator described in section 29.5.3 (pages 1044-1045) of [QuickSec51].

### 6.1.2.2 Cryptographic key distribution (FCS_CKM.2)

**FCS_CKM.2.1** The QuickSec cryptographic library in the Operational Environment TSEF shall distribute cryptographic keys in accordance with a specified cryptographic key distribution method defined in Table 21 that meets the following: the standards defined in Table 21.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Key distribution method</th>
<th>Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPsec</td>
<td>IKEv1</td>
<td>[RFC2409] The Internet Key Exchange (IKE); [RFC4109] Algorithms for Internet Key Exchange version 1 (IKEv1)</td>

<td>IKEv2</td>
<td>[RFC4306] Diffie-Hellman key agreement method defined for the IKEv2 protocol; [RFC4718] IKEv2 Clarifications and Implementation Guidelines</td>
</tr>
</tbody>
</table>

**Table 21: Cryptographic key distribution**

### 6.1.2.3 Cryptographic operation (FCS_COP.1)

**FCS_COP.1.1** The QuickSec cryptographic library in the Operational Environment TSEF shall perform the operations defined in Table 22 in accordance with a specified cryptographic algorithm defined in Table 22 and cryptographic key sizes defined in Table 22 that meet the following: the standards defined in Table 22.
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Operations</th>
<th>Algorithm</th>
<th>Key sizes (in bits)</th>
<th>Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPsec</td>

</tr>
<tr>
<td></td>
<td>Data authentication</td>
<td>HMAC-SHA1-96</td>
<td>96</td>
<td>[RFC2104] HMAC: Keyed-Hashing for Message Authentication</td>
</tr>
<tr>
<td></td>
<td></td>
<td>HMAC-SHA-384-192</td>
<td>384</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>HMAC-SHA-512-256</td>
<td>512</td>
<td></td>
</tr>
</tbody>
</table>

**Table 22: Cryptographic operations**

### 6.1.3 User data protection (FDP)

#### 6.1.3.1 Common access control SFP (FDP_ACC.1-cac)

**FDP_ACC.1.1** The TSF shall enforce the Common Access Control SFP in Table 23 on the list of users as subjects, objects, and operations among subjects and objects covered by the Common Access Control SFP in Table 23.

<table>
<thead>
<tr>
<th>Object</th>
<th>Operation(s)</th>
<th>Subject</th>
<th>Access control rules</th>
<th>[PP2600.2] section</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.FUNC</td>
<td>Modify, Delete</td>
<td>U.NORMAL</td>
<td>Denied, except for his/her own function data.</td>
<td>Common</td>
</tr>
<tr>
<td>D.DOC</td>
<td>Delete</td>
<td>U.NORMAL</td>
<td>Denied, except for his/her own documents.</td>
<td>Common</td>
</tr>
<tr>
<td>D.DOC+SCN²</td>
<td>Read</td>
<td>U.NORMAL</td>
<td>Denied, except for his/her own documents.</td>
<td>SCN</td>
</tr>
</tbody>
</table>

**Table 23: Common Access Control SFP**

#### 6.1.3.2 TOE function access control SFP (FDP_ACC.1-tfac)

**FDP_ACC.1.1** The TSF shall enforce the TOE Function Access Control SFP on users as subjects, TOE functions as objects, and the right to use the functions as operations.

---

² Since this is a single function device (i.e., a scanner), D.DOC and D.DOC+SCN are equivalent.
6.1.3.3 Common access control functions (FDP_ACF.1-cac)

FDP_ACF.1.1 The TSF shall enforce the Common Access Control SFP in Table 23 to objects based on the following: the list of users as subjects and objects controlled under the Common Access Control SFP in Table 23, and for each, the indicated security attributes in Table 23.

FDP_ACF.1.2 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: rules specified in the Common Access Control SFP in Table 23 governing access among controlled users as subjects and controlled objects using controlled operations on controlled objects.

FDP_ACF.1.3 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules:

- **U.ADMINISTRATOR** can delete any **D.DOC**.

FDP_ACF.1.4 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **none**.

6.1.3.4 TOE function access control functions (FDP_ACF.1-tfac)

FDP_ACF.1.1 The TSF shall enforce the TOE Function Access Control SFP to objects based on the following: users and the following TOE functions and security attributes:

- **Users**: Control Panel users;
  - Functions: F.SCN, F.SMI;
  - Security attributes:
    - User Role as defined by the user's Permission Set
    - Association of a sign in method to a Control Panel application
  - 
- **Users**: Administrative Computer;
  - Functions: F.SMI;
  - Security attributes:
    - User Role as defined by the user's IPsec/Firewall service templates.

**Application Note**: The "Allow users to choose alternate sign-in methods" function affects the sign in processing behavior of Control Panel users, but is considered a function instead of a security attribute and, thus, not listed under "security attributes" above.

FDP_ACF.1.2 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:

- **The user is explicitly authorized by U.ADMINISTRATOR to use a function**.

FDP_ACF.1.3 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: the user acts in the role U.ADMINISTRATOR, **none**.

FDP_ACF.1.4 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **none**.
6.1.3.5 Subset residual information protection (FDP_RIP.1)

FDP_RIP.1.1 The TSF shall ensure that any previous information content of a resource is made unavailable upon the deallocation of the resource from the following objects: D.DOC.

6.1.4 Identification and authentication (FIA)

6.1.4.1 Authentication failure handling (FIA_AFL.1)

FIA_AFL.1.1 The TSF shall detect when the Number for the specified Sign in method in Table 24 of unsuccessful authentication attempts occur related to the Event for the same Sign in method in Table 24.

FIA_AFL.1.2 When the defined number of unsuccessful authentication attempts has been met, the TSF shall perform the Action for the same Sign in method in Table 24.

Application Note: Multiple unsuccessful authentication attempts using the same authentication data are counted as just one unsuccessful authentication attempt by the sign in methods. For example, assuming the LDAP Sign In method has zero unsuccessful authentication attempts, if the same user types the same incorrect password into the LDAP Sign In method seven times in a row, the sign in method will only count it as one unsuccessful authentication attempt.

<table>
<thead>
<tr>
<th>Sign in method</th>
<th>Number</th>
<th>Event</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Device Sign In: Administrator Access Code</td>
<td>6</td>
<td>the last successful authentication for the Administrator Access Code</td>
<td>insert a 10 second delay between each Administrator Access Code authentication attempt until:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• a successful Administrator Access Code authentication occurs, or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 5 minutes elapses after the last failed Administrator Access Code authentication</td>
</tr>
<tr>
<td>Local Device Sign In: User Access Code</td>
<td>6</td>
<td>the last successful authentication for the User Access Code sign in method (i.e., per method, not per Access Code)</td>
<td>insert a 10 second delay between all User Access Code authentication attempts until:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• any successful User Access Code authentication occurs, or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 5 minutes elapses after the last failed authentication of all User Access Codes</td>
</tr>
<tr>
<td>LDAP Sign In</td>
<td>6</td>
<td>the last successful authentication for the indicated LDAP Sign In user</td>
<td>insert a 10 second delay between authentication attempts of the indicated user until:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• a successful authentication of the indicated user occurs, or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 5 minutes elapses after the last failed authentication attempt of the indicated user</td>
</tr>
</tbody>
</table>
### 6.1.4.2 Local user attribute definition (FIA_ATD.1)

**FIA_ATD.1** The TSF shall maintain the following list of security attributes belonging to individual users:

- **Control Panel users:**
  - User Identifier (Access Code and Display Name) for Local Device Sign In
  - User Role (defined by Permission Set)

- **IPsec users:**
  - User Identifier (defined by IP address)
  - User Role (defined by IPsec/Firewall service template)

**Application Note:**

The LDAP and Windows Sign In method security attributes belonging to individual users are not in FIA_ATD.1 because these attributes are "maintained" independently by the LDAP server and Windows domain controller, respectively, which are part of the Operational Environment.

### 6.1.4.3 Timing of Control Panel authentication (FIA_UAU.1)

**FIA_UAU.1.1** The TSF shall allow

- viewing of the Welcome message
- viewing of the Control Panel help screens
- selection of a sign in method

on behalf of the Control Panel user to be performed before the user is authenticated.

**FIA_UAU.1.2** The TSF shall require each Control Panel user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

### 6.1.4.4 IPsec authentication before any action (FIA_UAU.2)

**FIA_UAU.2.1** The TSF shall require each Administrative Computer and trusted IT product connection user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that connection user.

---

<table>
<thead>
<tr>
<th>Sign in method</th>
<th>Number</th>
<th>Event</th>
<th>Action</th>
</tr>
</thead>
</table>
| Windows Sign In | 6      | the last successful authentication for the indicated Windows Sign In user | insert a 10 second delay between authentication attempts of the indicated user until:  
  - a successful authentication of the indicated user occurs, or  
  - 5 minutes elapses after the last failed authentication attempt of the indicated user. |

**Table 24: Simplified Account Lockout for each sign in method**
6.1.4.5 Control Panel protected authentication feedback (FIA_UAU.7)

**FIA_UAU.7.1**
The TSF shall provide only asterisk characters for each
- Access Code character typed
- Authentication password character typed
to the user while the Control Panel authentication is in progress.

6.1.4.6 Timing of Control Panel identification (FIA_UID.1)

**FIA_UID.1.1**
The TSF shall allow
- viewing of the Welcome message
- viewing of the Control Panel help screens
- selection of a sign in method
on behalf of the Control Panel user to be performed before the user is identified.

**FIA_UID.1.2**
The TSF shall require each Control Panel user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

6.1.4.7 IPsec identification before any action (FIA_UID.2)

**FIA_UID.2.1**
The TSF shall require each Administrative Computer and trusted IT product connection user to be successfully identified before allowing any other TSF-mediated actions on behalf of that connection user.

6.1.4.8 User-subject binding (FIA_USB.1)

**FIA_USB.1.1**
The TSF shall associate the following user security attributes with subjects acting on behalf of that user: User Identifier (Display Name for Local Device Sign In, user name for both LDAP Sign In and Windows Sign In, IP address for IPsec) and User Role.

**FIA_USB.1.2**
The TSF shall enforce the following rules on the initial association of user security attributes with subjects acting on behalf of users: If "Allow users to choose alternate sign-in methods" is disabled, the user's session Permission Set will be reduced to exclude the permissions of applications whose sign in method does not match the sign in method used by the user to sign in.

**FIA_USB.1.3**
The TSF shall enforce the following rules governing changes to the user security attributes associated with the subjects acting on the behalf of users: none.

6.1.5 Security management (FMT)

6.1.5.1 Management of authentication security functions behavior (FMT_MOF.1)

**FMT_MOF.1.1**
The TSF shall restrict the ability to enable, disable the functions "Allow users to choose alternate sign-in methods" for Control Panel applications to U.ADMINISTRATOR.
6.1.5.2 Management of Permission Set security attributes (FMT_MSA.1-perm)

**FMT_MSA.1.1** The TSF shall enforce the Common Access Control SFP in Table 23 and TOE Function Access Control SFP to restrict the ability to modify, create, delete the security attributes Permission Sets and Permission Set associations to **U.ADMINISTRATOR**.

**Application Note:** The rule applies to all the Permission Sets except the Device Administrator and Device User. These default Permission Sets cannot be created, renamed or deleted. In addition, the permissions in Device Administrator Permission Set cannot be modified.

6.1.5.3 Management of TOE function security attributes (FMT_MSA.1-tfac)

**FMT_MSA.1.1** The TSF shall enforce the **TOE Function Access Control SFP** to restrict the ability to perform the following operations on the security attributes:

- IPsec/Firewall service templates (defining IPsec User Roles): create, modify, delete operations
- Association of a sign in method to a Control Panel application: modify operation

  to **U.ADMINISTRATOR**.

6.1.5.4 Management of TSF data (FMT_MTD.1-auth)

**FMT_MTD.1.1** The TSF shall restrict the ability to perform operations specified below for the:

- IPsec CA X.509v3 certificate: add, replace, delete operations
- IPsec identity X.509v3 certificate: replace operation
- IPsec/Firewall address templates and rules for IPsec users: create, modify, delete operations
- IPsec/Firewall address templates, service templates, and rules for trusted IT products: create, modify, delete operations

  to **U.ADMINISTRATOR**.

6.1.5.5 Management of TSF data (FMT_MTD.1-users)

**FMT_MTD.1.1** The TSF shall restrict the ability to modify, delete, initialize the **Device User Accounts** to **U.ADMINISTRATOR**.

6.1.5.6 Specification of management functions (FMT_SMF.1)

**FMT_SMF.1.1** The TSF shall be capable of performing the following management functions:

- IPsec/Firewall rules, address templates, and service templates management (FMT_MSA.1-tfac, FMT_MTD.1-auth)
- IPsec X.509v3 certificate management (FMT_MTD.1-auth)
- Local Device Sign In data (Access Code) management (FMT_MTD.1-users)
- Permission Set management (FMT_MSA.1-perm)
6.1.5.7 Security roles (FMT_SMR.1)

- **FMT_SMR.1.1** The TSF shall maintain the roles **U.ADMINISTRATOR, U.NORMAL**.
- **FMT_SMR.1.2** The TSF shall be able to associate users with roles.

6.1.6 Protection of the TSF (FPT)

6.1.6.1 Restricted forwarding of data to external interfaces (FPT_FDI_EXP.1)

- **FPT_FDI_EXP.1.1** The TSF shall provide the capability to restrict data received on any **external Interface** from being forwarded without further processing by the TSF to any **Shared-medium Interface**.

6.1.6.2 Reliable time stamps (FPT_STM.1)

- **FPT_STM.1.1** The TSF shall be able to provide reliable time stamps.

6.1.6.3 TSF testing (FPT_TST.1)

- **FPT_TST.1.1** The TSF shall run a suite of self tests **at the request of the authorised user** to demonstrate the correct operation of
  - System Clock - timestamp verification
  - Local Device Sign In - User Access Code verification
  - LDAP Sign In - LDAP settings verification
  - Windows Sign In (via Kerberos) - Windows Settings verification.

- **FPT_TST.1.2** The TSF shall provide authorised users with the capability to verify the integrity of
  - Local Device Sign In database
  - Device Administrator Password
  - User and administrator authentication configuration data (including Permission Sets and sign-in method assigned to top-level Control Panel application).

- **FPT_TST.1.3** The TSF shall provide authorised users with the capability to verify the integrity of **stored TSF executable code**.

6.1.7 TOE access (FTA)

6.1.7.1 Control Panel TSF-initiated termination (FTA_SSL.3)

- **FTA_SSL.3.1** The TSF shall terminate a Control Panel interactive session after any one of:
  - The user starts any job (if configured by U.ADMINISTRATOR)
  - 10 seconds after a user starts any job and the user agrees to the termination (if configured by U.ADMINISTRATOR)
6.1.8 Trusted path/channels (FTP)

6.1.8.1 Inter-TSF trusted channel (FTP_ITC.1)

FTP_ITC.1.1  The TSF shall provide a communication channel between itself and another trusted IT product that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel communicated data from modification or disclosure.

FTP_ITC.1.2  The TSF shall permit the TSF, another trusted IT product to initiate communication via the trusted channel.

FTP_ITC.1.3  The TSF shall initiate communication via the trusted channel for communication of D.DOC, D.FUNC, D.PROT, and D.CONF over any Shared-medium Interface.

6.2 Security Functional Requirements Rationale

6.2.1 Coverage

The following table provides a mapping of SFR to the security objectives, showing that each security functional requirement addresses at least one security objective.

<table>

**Table 25: Mapping of security functional requirements to security objectives**

### 6.2.2 Sufficiency

The following rationale provides justification for each security objective for the TOE, showing that the security functional requirements are suitable to meet and achieve the security objectives:

<table>
<thead>
<tr>
<th>Security objectives</th>
<th>Rationale</th>
</tr>
</thead>
</table>
| O.AUDIT.LOGGED      | The objective:  
  - The TOE shall create and maintain a log of TOE use and security-relevant events, and prevent its unauthorized disclosure or alteration.  
  is met by:  
  - FAU_GEN.1 which enforces audit policies by requiring logging of relevant events. |
<table>
<thead>
<tr>
<th>Security objectives</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>FAU_GEN.2</strong> which enforces audit policies by requiring logging of information associated with audited events.</td>
</tr>
<tr>
<td></td>
<td><strong>FIA_UID.1</strong> and <strong>FIA_UID.2</strong> which support audit policies by associating user identity with events</td>
</tr>
<tr>
<td></td>
<td><strong>FPT_STM.1</strong> which supports audit policies by requiring time stamps associated with events.</td>
</tr>

**O.PROT.NO_ALT**

The objective:

● The TOE shall protect TSF Protected Data from unauthorized alteration.

is met by:

● FCS_CKM.1 which specifies the type of cryptographic keys generated by the TOE for use with HMAC algorithms in IPsec.
● FCS_CKM.2 which specifies the cryptographic key distribution methods used by the TOE in IKEv1 and IKEv2 in IPsec.
● FCS_COP.1 which specifies the RSA decryption algorithm and the HMAC algorithms used by the TOE in IPsec.
● FIA_UID.1 and FIA_UID.2 which support access control and security roles by requiring user identification.
● FMT_MOF.1 which specifies the roles that can manage the selection of sign in methods.
● FMT_MTD.1-auth and FMT_MTD.1-users which enforce protection by restricting access.
● FMT_SMF.1 which supports control of security attributes by requiring functions to control attributes.
● FMT_SMR.1 which supports control of security attributes by requiring security roles.
● FTP_ITC.1 which enforces protection by requiring the use of trusted channels for communication of data over Shared-medium Interfaces.

**O.SOFTWARE.VERIFIED**

The objective:

● The TOE shall provide procedures to self-verify executable code in the TSF.

is met by:

● FPT_TST.1 which enforces verification of software by requiring the TOE include self-tests.

**O.USER.AUTHORIZED**

The objective:

● The TOE shall require identification and authentication of Users, and shall ensure that Users are authorized in accordance with security policies before allowing them to use the TOE.

is met by:

● FDP_ACC.1-tfac which enforces authorization by establishing an access control policy.
● FDP_ACF.1-tfac which supports access control policy by providing access control function.

**Table 28: Security assurance requirements**

### 6.4 Security Assurance Requirements Rationale

The evaluation assurance level has been chosen to match a Basic attack potential commensurate with the threat environment that is experienced by typical consumers of the TOE and commensurate with [PP2600.2]. In addition, the evaluation assurance level has been augmented with ALC_FLR.2 commensurate with the augmented flaw remediation capabilities offered by the developer beyond those required by the evaluation assurance level and commensurate with [PP2600.2].
7 TOE Summary Specification

7.1 TOE Security Functionality

The following section explains how the security functions are implemented by the TOE. The different TOE security functions cover the various SFR classes.

The primary security features of the TOE are:

- Auditing
- Cryptography
- Identification and authentication
- Data protection and access control
- Protection of the TSF
- TOE access protection
- Trusted channel communication and certificate management
- User and access management

7.1.1 Auditing

The TOE performs auditing of security relevant functions. The TOE connects and sends audit records to a syslog server (part of the Operational Environment) for long-term storage and audit review. The records sent to the syslog server by the TOE are only those generated by the TOE while the syslog server has an established connection with the TOE. If the connection between the TOE and syslog server breaks and is later reestablished, only records generated by the TOE after the connection is reestablished are sent to the syslog server. Both the Jetdirect Inside and HCD System firmware generate audit records.

The types of records generated by the TOE are specified in section 6.1.1.1. Each record includes the date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event. Events resulting from actions of identified users are associated with the identity of the user that caused the event.

The subject identity used in the audit record is formed in the following manner. For Local Device Sign In, the subject's identity contains the user's Display Name prefixed with "LOCAL\". For LDAP Sign In, the subject's identity contains the user's LDAP user name prefixed with "<LDAP server IP address>\" or "<LDAP server hostname>\". For Windows Sign In, the subject's identity contains the user's Windows domain name and Windows user name separated by a "\". For IPsec, the subject's identity is the user's IP address.

The time source used for the audit record timestamps is discussed in section 7.1.5.3.

This section maps to the following SFRs:

- FAU_GEN.1
- FAU_GEN.2

7.1.2 Cryptography

The TOE uses IPsec to protect its communications channels. The QuickSec cryptographic library, which is part of the Operational Environment, is used to supply the cryptographic algorithms for IPsec. See section 7.1.7 for more information.
7.1.3 Identification and authentication (I&A)

The TOE supports multiple Control Panel sign in methods, both local and remote methods. It also supports IPsec identification and mutual authentication.

The following interfaces support I&A:

- Control Panel
- IPsec

7.1.3.1 Control Panel I&A

The Control Panel interface supports both local and remote sign in methods. The following sign in methods are allowed with the evaluated configuration:

- Local sign in method:
  - Local Device Sign In

- Remote sign in methods:
  - LDAP Sign In
  - Windows Sign In (via Kerberos)

(The servers for the remote sign in methods are part of the Operational Environment.)

The Control Panel also allows both non-administrative users (U.NORMAL) and administrative users (U.ADMINISTRATOR) to sign in. Prior to signing in, the TOE can be configured to display a Welcome message on which the user must press "OK" before the user can access the sign in screen. At the sign in screen, the user may get help on various printer functions or select a sign in method prior to signing in.

Local Device Sign In is only available through the Control Panel. The TOE contains a local user database for defining non-administrative (U.NORMAL, by default) device user and administrative (U.ADMINISTRATOR) device user accounts used to support the Local Device Sign In mechanism. Each device user account contains the following security attributes:

- Access Code
- Display Name
- Permission Set

The User Access Code is a number that serves as both the login user identifier and the authentication secret. Each user's User Access Code is unique from all other Local Device users. In the evaluated configuration, the User Access Code length must be 8 digits, which is the largest length for a User Access Code allowed by the TOE. The length of the User Access Code is manually enforced by the administrator.

The Administrator Access Code, also known as the Device Administrator Password, can be as long as 16 characters and composed of letters, numbers, and special characters. The Device Administrator Password can also be used to sign in to the EWS or the Web Services interface from a remote computer in addition to signing in at the Control Panel.

The Display Name is a unique name assigned to the account by the administrator. This name is a security attribute because it is used in audit records to identify the user. (The Access Code is not written in the audit records.)

The Permission Set defines/determines a user's access to many of the TOE's functions. Permission Sets are discussed in more detail in section 7.1.4.1.
Like Local Device Sign In, the remote sign in methods are only used by the Control Panel. The TOE receives authentication credentials from the Control Panel users and passes the credentials to the remote authentication server via the remote sign in method. The remote sign in method returns an authentication decision to the TOE. This decision is then enforced by the TOE by granting or denying access to the Control Panel user.

In the case of LDAP, the user name and password entered at the Control Panel are used to bind to the LDAP server. The user must have a valid and active LDAP account in order to successfully bind using this method.

In the case of Kerberos, the user name and password entered at the Control Panel are used to authenticate with the Windows domain controller. The user must have a valid and active Windows domain account in order to successfully bind using this method.

When a user successfully logs in to the Control Panel, the Permission Set associated with that user is bound to that user instance and defines the user's User Role.

When users authenticate through the Control Panel, the TOE displays asterisks for each character of an Access Code or password typed to prevent onlookers from viewing another user's authentication data.

The TOE contains a feature called Simplified Account Lockout to help protect against brute-force attacks at the Control Panel. Each Control Panel sign in method performs its Simplified Account Lockout independent of the other Control Panel sign in methods.

The Administrator Access Code method inserts a 10 second delay between each Administrator Access Code authentication attempt upon reaching 6 failed attempts. It keeps inserting the delay until either:

- a valid Administrator Access Code is entered, or
- 5 minutes elapses after the last failed Administrator Access Code authentication attempt.

The User Access Code method inserts a 10 second delay between each User Access Code authentication attempt upon reaching 6 failed attempts. The failed attempts count is cumulative for the entire method, not per Access Code. It keeps inserting the delay until either:

- any valid User Access Code is entered, or
- 5 minutes elapses after all failed User Access Code authentication attempts.

The LDAP Sign In method inserts a 10 second delay between each authentication attempt by the same LDAP user upon reaching 6 failed attempts. It keeps inserting the delay until either:

- the indicated LDAP user successfully authenticates, or
- 5 minutes elapses after the last failed authentication attempt by the indicated LDAP user.

Like the LDAP Sign In method, the Windows Sign In method inserts a 10 second delay between each authentication attempt by the same Windows user upon reaching 6 failed attempts. It keeps inserting the delay until either:

- the indicated Windows user successfully authenticates, or
- 5 minutes elapses after the last failed authentication attempt by the indicated Windows user.

Multiple unsuccessful authentication attempts using the same authentication data are counted as just one unsuccessful authentication attempt by the sign in methods. For example, assuming the LDAP Sign In method has zero unsuccessful authentication attempts, if the same user types the same incorrect password into the LDAP Sign In method seven times in a row, the sign in method will only count it as one unsuccessful authentication attempt.
This section maps to the following SFRs:

- FIA_AFL.1
- FIA_ATD.1 (Access Code, User Role)
- FIA_UAU.1
- FIA_UAU.7
- FIA_UID.1
- FIA_USB.1
- FMT_SMR.1

### 7.1.3.2 IPsec I&A

The TOE uses IPsec to identify and mutually authenticate the Administrative Computer (U.ADMINISTRATOR).

IPsec uses IP addresses and X.509v3 certificates via the IKE protocols (IKEv1 and IKEv2) to identify and authenticate, respectively, the Administrative Computer. The TOE contains an X.509v3 identity certificate and an X.509v3 CA certificate to use for the IPsec mutual authentication. The TOE does not maintain individual X.509v3 certificates of the Administrative Computer.

The User Identity of an Administrative Computer is its IP address. The TOE's internal firewall maintains the IP address of the Administrative Computer in an IPsec/Firewall address template. If a computer has an IP address that is not defined in the IPsec/Firewall as the Administrative Computer or the Administrative Computer attempts to establish an IPsec connection using security parameters (i.e. encryption algorithm) not supported in the evaluated configuration, then the computer is not allowed to connect to the TOE. Similarly, if the Administrative Computer presents an invalid or unknown (unrecognized CA) X.509v3 certificate, the IPsec mutual authentication mechanism will fail.

The TOE also uses IP addresses and X.509v3 certificates via the IKE protocols to connect to and identify other trusted IT products. See section 7.1.7 for more details.

The TOE supports the following versions of the IKE protocol:

- IKEv1 ([RFC2409] and [RFC4109])
- IKEv2 ([RFC4306] and [RFC4718])

The TOE must use IKE Main Mode for key exchange in the evaluated configuration.

Mutual identification and authentication must be completed before any tasks can be performed by the Administrative Computer.

The service templates are used to define the User Role of a computer. The following service template is used to define the TOE's User Roles for IPsec users:

- All Services (U.ADMINISTRATOR)

The All Services service template is provided with the TOE.

Only the Administrative Computer can access the EWS (HTTP) interface, Web Services interface (OXPd and WS-*), and SNMP interface.

IP address management is discussed in section 7.1.4.3. Certificate management is discussed in section 7.1.7.

This section maps to the following SFRs:

- FIA_ATD.1
- FIA_UAU.2
7.1.4 Data protection and access control

7.1.4.1 Permission Sets

For Control Panel users, the TOE uses a user's User Role (as determined by each user's Permission Set) to determine a user's access to many TOE functions. Only U.ADMINISTRATOR can create, modify, and delete Permission Sets. In addition, only U.ADMINISTRATOR can create, modify, and delete the Permission Set associations to users. By default, the TOE includes the following Permission Sets:

- Device Administrator (U.ADMINISTRATOR)
- Device User (U.NORMAL)

These default Permission Sets cannot be created, renamed or deleted. In addition, the permissions in Device Administrator cannot be modified.

Permissions in a Permission Set include permissions as high-level as scan. They also include more granular permissions that can control various aspects of administrative functions. Each permission in a Permission Set has two possible values: allowed and disallowed.

This section maps to the following SFRs:

- FMT_MSA.1-perm
- FMT_SMF.1

7.1.4.2 Common access control

Scan jobs are ephemeral on the TOE by design. The TOE does not provide a user the ability to store a scan job on the HCD and retrieve it later. Because of this, only the U.NORMAL user creating the scan job has access to the scan job and only this user can read and delete the scan job document (D.DOC) and modify and delete the job's function data (D.FUNC). Other U.NORMAL users do not have access to this scan job. In addition, an administrator can delete (cancel) an active scan job due to an enabled permission in the Device Administrator Permission Set.

Since this is a single function device (i.e., a scanner), D.DOC and D.DOC+SCN are equivalent and D.FUNC and D.FUNC+SCN are equivalent.

This section maps to the following SFRs:

- FDP_ACC.1-cac
- FDP_ACF.1-cac

7.1.4.3 TOE function access control

The TOE controls Control Panel access to TOE functions through the use of Permission Sets. The home screen sign in process assigns the Permission Set to the authenticated user's session. This session Permission Set becomes the user's User Role. Access to each TOE device function is configurable in a Permission Set by an administrator. A user can perform any function permitted in the session Permission Set. Control Panel applications use the user's Permission Set to determine
which of the application's functions should be allowed or disallowed for the user. A Control Panel user can perform the [PP2600.2] functions of F.SCN, and F.SMI as determined by the user's Permission Set.

Each Control Panel application requires the user to have one or more specific permissions in their session Permission Set in order to access that application. In addition, the TOE's administrator can map sign in methods to each Control Panel application and require the user to be authenticated to that sign in method in order to access that application. The individual applications only check and enforce permissions. They do not check the sign in methods. Instead, the TOE enforces the sign in method requirement at the time that the user signs in to the TOE by removing permissions from the user's session Permission Set for each application in which the user's sign in method does not match the sign in method required by the TOE. By removing the permissions required by each non-matching application, the TOE limits the set of applications that the user can access.

Administrators can change/modify the sign in method mapped to each application. In addition, the TOE provides the feature "Allows users to choose alternate sign-in methods" which allows administrators to select if the sign in method application mappings are enforced or ignored by the TOE. It is a function in the configuration settings which can be configured through the EWS (HTTP) or WS-* web services. When this function is disabled, the TOE enforces the "sign in method to application" mappings and prunes (reduces) the user's session Permission Set accordingly. When this function is enabled, the sign in method mappings are ignored by the TOE and the user's session Permission Set remains unchanged.

For IPsec users, the TOE uses the IPsec/Firewall to control access to the supported network protocols. The IPsec/Firewall contains the IP address of the Administrative Computer in an address template and the network service protocols grouped into service templates. The administrator maps the address template to the service template using an IPsec/Firewall rule. Service templates, therefore, act as the User Roles for IPsec users. IP addresses of computers not contained in a rule are denied access to the TOE. The [PP2600.2] function available to an authorized computer is F.SMI.

This section maps to the following SFRs:
- FDP_ACC.1-tfac
- FDP_ACF.1-tfac

### 7.1.4.4 Residual information protection

When the TOE deletes an object defined in section 6.1.3.5, the contents of the object are no longer available to TOE users.

This section maps to the following SFR:
- FDP_RIP.1

### 7.1.5 Protection of the TSF

#### 7.1.5.1 Restricted forwarding of data to external interfaces

The TOE prevents the forwarding of data received from an External Interface to the Shared-medium Interface. It does this by disabling all External Interfaces except for the Shared-medium Interface.

This section maps to the following SFR:
- FPT_FDI_EXP.1
7.1.5.2 TSF self-testing

The EWS interface allows an administrator (U.ADMINISTRATOR) to execute a set of correct operations tests, TSF Data integrity tests, and integrity tests of TSF executable code. The specific security related tests available to the administrator are listed in FPT_TST.1. In some cases, the tests can only be executed if the system is configured to use the feature being tested. For example, the LDAP Settings verification test requires LDAP Sign In to be configured prior to executing the test. The tests that may be available during self-test include:

- Timestamp verification (verify a Network Time Server is configured and responding)
- Device User Access Code verification
- LDAP settings verification
- Windows Setting verification

This section maps to the following SFR:

- FPT_TST.1

7.1.5.3 Reliable timestamps

The TOE contains a system clock that is used to generate reliable timestamps. Only administrators can manage the system clock.

The administrator must configure the device to synchronize the system clock via a Network Time Protocol (NTP) server.

This section maps to the following SFR:

- FPT_STM.1

7.1.6 TOE access protection

The following session termination mechanisms are supported by the TOE:

- Inactivity timeout
- Automatic logout

7.1.6.1 Inactivity timeout

The TOE supports an inactivity timeout for Control Panel sessions. If a logged in user is inactive for longer than 20 seconds, the user is automatically logged off of the system. Only one inactivity period setting exists per TOE.

This section maps to the following SFR:

- FTA_SSL.3

7.1.6.2 Automatic logout

The administrator can optionally configure the TOE to automatically sign users out after starting a job. The user can be signed out immediately or with a delay of 10 seconds during which time the user can select to remain signed in. If enabled, after initiating a job, the TOE displays a screen informing the user of job termination immediately or in 10 seconds. If given the option and the user chooses to remain signed in, the Inactivity Timeout timer is started.

This section maps to the following SFR:
7.1.7 Trusted channel communication and certificate management

Shared-medium communications (i.e., Ethernet network) between the TOE and other trusted IT products use a trusted channel mechanism to protect the communications from disclosure and modification. The TOE also ensures the cryptographic operations are validated during policy processing such as validating digital signatures or encrypting and decrypting data. The following table provides a list of the mechanism(s) used to protect these channels and the channels protected by the mechanism(s).

<table>

Table 29: Trusted channel connections

The TOE uses IPsec as means to provide trusted channel communications. IPsec uses X.509v3 certificates, the ESP, ISAKMP, IKEv1, and IKEv2 protocols, and the cryptographic algorithms listed below to protect communications.

The cryptographic functions used by IPsec are implemented in the QuickSec cryptographic library version 5.1 ([QuickSec51]) which is produced by SafeNet, Inc. The QuickSec cryptographic library is part of the Operational Environment, not the TOE. The TOE prepares the data and invokes the appropriate cryptographic functions, but the code in the QuickSec cryptographic library performs the processing and calculations required. SafeNet, Inc. performs regular and rigorous developer testing of the implementation of the cryptographic algorithms in the QuickSec cryptographic library.

In the evaluated configuration, the supported IPsec cryptographic algorithms are:

- RSA 1024-bit, 2048-bit, and 4096-bit (Operational Environment)
- AES-128, AES-192, and AES-256 in CBC mode (Operational Environment)
- HMAC-SHA1-96 (Operational Environment)
- HMAC-SHA-256-128 (Operational Environment)
- HMAC-SHA-384-196 (Operational Environment)
IPsec is conformant to the MUST/MUST NOT requirements of the following IETF RFCs:

- [RFC4301] and [RFC4894] for IPsec
- [RFC4303] for ESP
- [RFC4306] for ISAKMP
- [RFC4109] and [RFC4894] for IKEv1
- [RFC4306], [RFC4718], and [RFC4894] for IKEv2.

The TOE maintains two X.509v3 certificates for IPsec in the Jetdirect certificate store:

- Identity certificate
- Certificate Authority (CA) certificate

The EWS (HTTP) and WS-* interfaces allow administrators to manage these X.509v3 certificates used by IPsec.

When the TOE is first powered on, the Jetdirect Inside firmware generates its own self-signed identity certificate; however, this certificate is not permitted in the evaluated configuration. The administrator is required to replace the self-signed identity certificate created by the TOE when first powered on with an identity certificate created outside the TOE and signed by a Certificate Authority. The TOE requires that an identity certificate always exist; therefore, it supports the ability for an administrator to replace the identity certificate.

The TOE requires a CA certificate, but it does not come with a CA certificate pre-installed. The administrator must obtain a CA certificate from the Operational Environment, and then add the CA certificate to the TOE when configuring the TOE. The TOE allows an administrator to add, replace, and delete the CA certificate used by IPsec.

- FMT_MTD.1-auth
- FMT_SMF.1
- FTP_ITC.1

### 7.1.8 User and access management

The TOE supports the following roles:

- Administrators (U.ADMINISTRATOR)
- Users (U.NORMAL)

Administrators maintain and configure the TOE and Operational Environment. Users perform the standard scan functions provided by the system.

In addition, the TOE performs many security management functions.
Only administrators can configure which computer is allowed to connect to the TOE as the Administrative Computer and to configure the list of other trusted IT products to which the TOE will connect. Administrators do this by creating, modifying, and deleting IPsec/Firewall address templates, service templates, and rules via the TOE. Similarly, only administrators can create, modify, and delete address templates, service templates, and rules via the TOE for trusted IT products.

For each Control Panel application, an administrator can modify the association of a sign in method to an application. (for example, the administrator can associate LDAP Sign In method to the Copy application). In addition, administrators control whether or not a Control Panel user must use the administrator-selected sign in method associated with the applications in order to access that application. This latter feature is controlled through the “Allow users to choose alternate sign-in methods” function.

Administrators can initialize, modify, and delete Device User Accounts in the Local Device Sign In database.

8 Abbreviations, Terminology and References

8.1 Abbreviations

AES
Advanced Encryption Standard

AH
Authentication Header (IPsec)

ASCII
American Standard Code for Information Interchange

CA
Certificate Authority

CBC
Cipher Block Chaining

CIFS
Common Internet File System

DCW
Document Capture Workstation

DNS
Domain Name System

ESP
Encapsulating Security Payload (IPsec)

EWS
Embedded Web Server

FTP
File Transfer Protocol

HCD
Hardcopy Device

HMAC
Hashed Message Authentication Code

HP
Hewlett-Packard

HTML
Hypertext Markup Language

HTTP
Hypertext Transfer Protocol

IEEE
Institute of Electrical and Electronics Engineers, Inc.

IKE
Internet Key Exchange (IPsec)

IP
Internet Protocol
IPsec
Internet Protocol Security

ISAKMP
Internet Security Association Key Management Protocol (IPsec)

LCD
Liquid Crystal Display

LDAP
Lightweight Directory Access Protocol

MAC
Message Authentication Code

NTLM
Microsoft NT LAN Manager

NTP
Network Time Protocol

OXP
Open Extensibility Platform

OXPD
OXP device layer

PIN
Personal Identification Number

SFR
Security Functional Requirement

SHA
Secure Hash Algorithm

SMTP
Simple Mail Transfer Protocol

SNMP
Simple Network Management Protocol

SOAP
Simple Object Access Protocol

SSH
Secure Shell

TOE
Target of Evaluation

USB
Universal Serial Bus

WINS
Windows Internet Name Service

XML
Extensible Markup Language
8.2 Terminology

This section contains definitions of technical terms that are used with a meaning specific to this document. Terms defined in the [CC] are not reiterated here, unless stated otherwise.

**Administrative User**
This term refers to a user with administrative control of the TOE.

**Authentication Data**
This includes the Access Code and/or password for each user of the product.

**Control Panel Application**
An application that resides in the firmware and is selectable by the user via the Control Panel.

**Device Administrator Password**
The password used to restrict access to administrative tasks via EWS and the Control Panel. This password is also required to associate a user with the Administrator role. In product documentation, it may also be referred to as the Local Device Administrator Password, Local Device Administrator Access Code, the Device Password, or the Administrator Password.

**External Interface**
A non-hardcopy interface where either the input is being received from outside the TOE or the output is delivered to a destination outside the TOE.

**Hardcopy Device (HCD)**
This term generically refers to the product models in this Security Target.

**Shared-medium Interface**
Mechanism for transmitting or receiving data that uses wired or wireless network or non-network electronic methods over a communications medium which, in conventional practice, is or can be simultaneously accessed by multiple users.

**User Security Attributes**
Defined by functional requirement FIA_ATD.1, every user is associated with one or more security attributes which allow the TOE to enforce its security functions on this user.
